비공개 (회사 및 클라이언트 작업) / Private

상태 / STATUS
Client production

부동산 중개인용 B2B AI 플랫폼입니다. 기존 B2C 인테리어 앱 위에 B2B 전환을 제안하고 1주 만에 혼자 설계하고 구축했습니다. 고객과 매물 관리, RAG 챗봇, 자동 리포트, 스테이징 분석, 현장용 모바일 페이지를 담았습니다. 한 컨퍼런스에서 투자 문의가 2건에서 11건으로 늘었습니다.

문제 / PROBLEM

The company's consumer interior-design app had users but little investor interest. Realtors kept asking for the same AI staging and research tools, but wrapped in a workflow built around their clients and listings, not around one-off room makeovers.

구현 / WHAT I BUILT

I proposed the pivot to realtors and built the platform alone in 1 week. It runs on Next.js, FastAPI, and PostgreSQL. Realtors manage clients and properties in one place and chat with an AI assistant that answers from listing data, client context, web research, and PDFs they upload. The app writes buyer and seller reports as PDF or a shareable web page with the realtor's own branding, and checks listing photos and descriptions against National Association of Realtors staging guidance. A mobile page serves showings, and a workflow dashboard chains research, staging posts, and reports into 1 click. A Chrome extension carries the user's data onto other platforms.

구조 / ARCHITECTURE

The web app talks to one FastAPI backend. Listing and client data live in PostgreSQL on Supabase, where pgvector powers search over text chunks embedded with Gemini. LangGraph runs the assistant, and a renderer turns report data into PDF and HTML. The Chrome extension calls the same API.

```
Next.js app ⟶ FastAPI ⟶ PostgreSQL (pgvector) ⟶ Gemini embeddings ⟶ LangGraph assistant ⟶ PDF / HTML reports
```

결과 / RESULT

- MVP live in 1 week, built solo
- 11 investor inquiries at one startup conference, up from 2 for the consumer product
- One of 2 B2B AI apps I build and maintain

트러블슈팅 / TROUBLESHOOTING

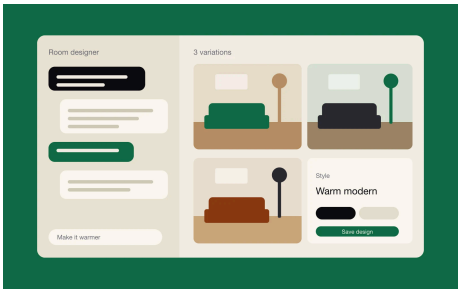

Problem: realtors uploaded their own PDFs and expected the assistant to answer from them. Cause: a model cannot read long documents reliably in one prompt, and each user's files must stay private. Fix: I split each PDF into chunks, turned them into vectors, and stored them in Supabase pgvector as a per-user knowledge base. Result: the assistant answers from each realtor's own documents.

다음 / NEXT

Add an evaluation set that scores the assistant's answers, and usage analytics per workflow.

Button app to AI chat app

LangGraph + 40,000+ product catalog; chat became the main way users use the product

기간 / PERIOD
2026

소속 / ORG
SDI Creative Technologies

역할·인원 / ROLE & TEAM
Fullstack & AI engineer (sole builder). Solo build; product team of 3 gave requirements

기여도 / CONTRIBUTION
100% of the chat rebuild

스택 / STACK
LangGraph, Neo4j, GraphRAG

링크 / LINKS
비공개 (회사 및 클라이언트 작업) / Private

상태 / STATUS
Live

버튼 기반 B2C 인테리어 앱을 대화형 AI 앱으로 전환하는 일을 제안하고 구축했습니다. LangGraph 에이전트와 4만+ 노드 지식그래프 기반 GraphRAG 추천, 4만+ 제품 카탈로그를 연결했습니다. 31개 디자인 컨셉을 분류하는 퀴즈로 방을 새로 꾸민 이미지를 만들어 줍니다. 채팅이 제품의 주된 사용 방식이 되었고 기존 화면은 내려갔습니다.

문제 / PROBLEM

The interior-design app guided users through fixed buttons, one step at a time. People could not ask what they actually wanted, and the app could not use what it already knew about their taste.

구현 / WHAT I BUILT

I proposed replacing the button flow with an AI chat and led the build. It runs on LangGraph, which manages the conversation, the tools the AI can call, and what it remembers. Claude handles the conversation and Gemini generates room images, and I tested and debugged the agent with LangSmith. A quiz sorts each user into one of 31 design concepts, then the app renders a makeover of their room and recommends real furniture from a catalog of 40,000+ products. Behind this sits a knowledge graph of 40,000+ nodes on Neo4j that links each concept to materials, colors, and product traits.

구조 / ARCHITECTURE

The chat agent decides which tool to call: the quiz, the recommender, or the image generator. Recommendations use GraphRAG, meaning the agent walks the knowledge graph to find what fits a concept and budget, then writes a detailed image prompt from the result. A scraping pipeline keeps the product catalog fresh.

```
Flask API ⟶ LangGraph agent ⟶ Claude + Gemini ⟶ Neo4j knowledge graph (GraphRAG) ⟶ product catalog
```

결과 / RESULT

- Chat became the main way users use the product, and the old button interface was retired
- Knowledge graph of 40,000+ nodes covering 31 design concepts
- Recommendations drawn from a catalog of 40,000+ products

트러블슈팅 / TROUBLESHOOTING

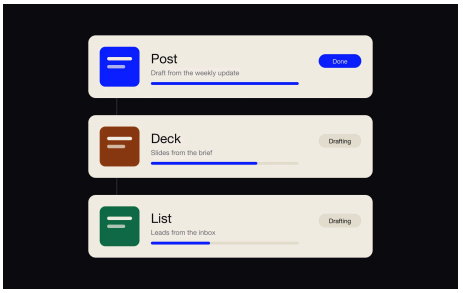

Problem: the recommendations ignored the user's context and taste. Cause: a plain product search had no way to connect a design concept to materials, colors, and product traits. Fix: I built a knowledge graph of 40,000+ nodes on Neo4j (31 concepts linked to materials, colors, and products) and generated prompts with GraphRAG. Result: recommendations are now built from the user's own concept and context.

다음 / NEXT

Add latency and cost dashboards for each tool call the agent makes.

AI implementation for 3 client companies

Public-tender research and deck 1-2 days to 2-3 hours; reels and blog 2-3 days to 1-2 hours

기간 / PERIOD
2026 (ongoing)

소속 / ORG
SDI Creative Technologies

AI implementation lead. Lead; worked directly with each client team

기여도 / CONTRIBUTION
Lead (100% of AI build)

스택 / STACK
LangGraph, Claude Code, Automation

링크 / LINKS
비공개 (회사 및 클라이언트 작업) / Private

상태 / STATUS
Client production

SDI 고객사 3곳(교육, 이벤트, 신용평가 업종)의 AI 구현을 이끌었습니다. 공공입찰 조사와 제안서 초안은 건당 1~2일에서 2~3시간으로, 릴스와 블로그 제작은 2~3일에서 1~2시간으로 줄였습니다. 여러 출처의 대용량 데이터를 시각 목록으로 정리하는 작업도 맡았습니다. 각 고객 팀에 Claude Code 사용법을 교육해 직접 확장할 수 있게 했습니다.

문제 / PROBLEM

Three client teams did repetitive knowledge work by hand. An education agency made social and blog content one piece at a time. An event agency researched each public tender and built the bid deck from scratch. A credit rating agency sifted through large volumes of data from several sources.

구현 / WHAT I BUILT

I lead AI implementation for all 3 companies. For the education agency, I automated the content workflow across YouTube, Instagram, Facebook, and the blog. For the event agency, I built a pipeline on LangGraph over their own knowledge base that screens new public-tender postings and drafts the proposal deck. For the credit rating agency, I built a pipeline that pulls data from many sources and lays it out as visual lists. I also trained each team on Claude Code so they can extend the automations themselves.

구조 / ARCHITECTURE

Each client gets its own knowledge base, so nothing is shared between companies. LangGraph workers read that knowledge, do the research or analysis step by step, and produce the output the team needs: a post, a deck, or a list. Claude Code skills give staff a simple way to adjust the workers.

```
Per-client knowledge base ⟶ LangGraph workers ⟶ posts, bid decks, visual lists ⟶
Claude Code skills for the team
```

결과 / RESULT

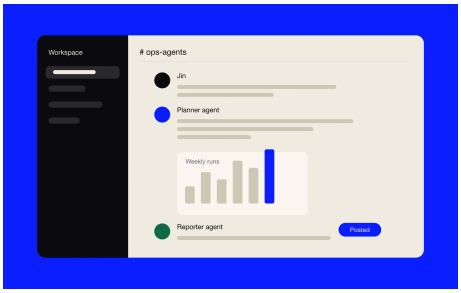

- Reels and blog production: 2-3 days to 1-2 hours
- Bid research and deck per tender: 1-2 days to 2-3 hours
- 3 client teams trained to extend the automations on their own

다음 / NEXT

Build a shared scoring rubric so generated decks are reviewed the same way each time.

Hermes: multi-agent Slack platform

2-3 hours saved per person daily; onboarding 1:1 **2-3 hours to 30 minutes**

기간 / PERIOD
2026 (ongoing)

소속 / ORG
SDI Creative Technologies (internal)

역할·인원 / ROLE & TEAM
AI implementation lead. Lead and sole builder; rolled out to 3 internal teams

기여도 / CONTRIBUTION
100%

스택 / STACK
Slack, Claude Code, Agents

링크 / LINKS
비공개 (회사 및 클라이언트 작업) / Private

상태 / STATUS
Live

SDI 사내 멀티에이전트 Slack 플랫폼입니다. 에이전트가 버그를 고치고, 일일 데이터와 마케팅 리포트를 올리고, 비개발 직원의 데이터 질문에 답하며, 신입 온보딩 챗봇 역할도 합니다. 마케팅, 디자인, PM 팀에는 팀별 Claude Code 서브에이전트와 스킬을 배포하고 교육했습니다. 1인당 하루 2~3시간을 절약했고 온보딩 1:1은 2~3시간에서 30분으로 줄었습니다.

문제 / PROBLEM

Reports were pulled by hand from separate tools, onboarding new hires took senior staff hours of one-on-one time, and non-engineers had no easy way to ask the company's data a question.

구현 / WHAT I BUILT

I built Hermes, a Slack platform where AI agents do this work in the channels people already use. Agents fix bugs, post daily marketing and data reports, and answer office staff. A chatbot takes newcomers' questions. I also set up Claude Code subagents and skills for each team and trained them. Marketing got an ad pipeline from research to posting. Design got AI design tools. Product managers got a pipeline that turns a feature idea into clarifying questions, a branch, a tech spec, and GitHub issues. Automated deploys, error alerts, and daily tests run on GitHub Actions, Sentry, and Slack.

구조 / ARCHITECTURE

A message in Slack goes to a router that picks the right agent for the job: bug fix, report, or question. Each agent reaches the code repositories, data, and Slack through its own limited access, then replies in the thread. Team skills sit beside it so each department can tune its own workflow.

```
Slack ⟶ agent router ⟶ task agents (bug fix, report, Q&A) ⟶ repos, data, Slack replies
```

결과 / RESULT

- **2-3 hours** saved per person daily
- Ad production: **2-3 days to half a day**
- 1:1 onboarding: **2-3 hours to 30 minutes**
- Production issues caught: **2-3 per week** before users reported them

트러블슈팅 / TROUBLESHOOTING

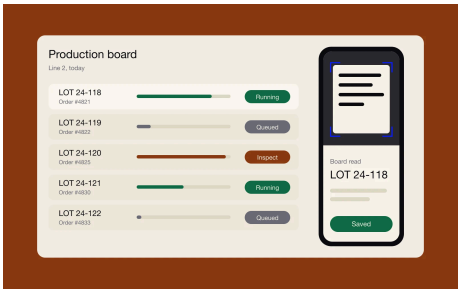

Problem: production errors were going unnoticed until users complained. Cause: nothing connected the deploys, the error tracker, and the channels the team reads. Fix: I wired GitHub Actions, Sentry, and Slack together so each issue became a real-time alert. Result: **2-3 issues per week** are now caught before users report them.

다음 / NEXT

Turn agent run logs into a weekly review of cost and answer quality.

AI ERP and photo reading for a plating factory

Office team 3 to 1 manager; 10 stations of handwritten boards read by AI; cloud cost -90%

기간 / PERIOD
Jun 2025 – present

소속 / ORG
IntelliWorks (my consultancy)

역할·인원 / ROLE & TEAM
Founder, on-site engineer. Founder, sole engineer; trained 3 client staff

기여도 / CONTRIBUTION
100%

스택 / STACK
React, Node.js, PostgreSQL

링크 / LINKS
비공개 (회사 및 클라이언트 작업) / Private

상태 / STATUS
Client production

직접 세운 IntelliWorks에서 20인 도금공장에 상주하며 모든 직급을 인터뷰해 품질 분쟁의 원인을 찾고 ERP를 구축했습니다. LOT 추적, 고객 실시간 조회 포털, 다국어 챗봇, 10개 스테이션 현황판 사진 판독을 포함합니다. 사무 인력은 3명에서 1명으로, 클라우드 비용은 90% 줄었습니다. 핵심 직원 교육으로 자립 운영이 가능하고 50인 규모의 두 번째 공장도 진행 중입니다.

문제 / PROBLEM

A plating factory with 20 employees ran on verbal handoffs, paper logs, and no record of what happened to each order. That led to repeated quality disputes with its 40+ business customers.

구현 / WHAT I BUILT

I went on-site, interviewed workers at every level, and found that the missing paper trail was the root cause. Then I built the factory's system on React, Node.js, and PostgreSQL. Every order is tracked by LOT through each plating step. A customer portal shows the 40+ customers live order status. A built-in chatbot lets workers ask in their own language and lets managers ask for data in plain words. Workers now photograph the handwritten status boards at 10 stations and AI reads them. Slack agents handle sales reports and month-end emails, and I trained 3 key staff to run it all without me.

구조 / ARCHITECTURE

The app runs on AWS. Photos go to S3, an OCR step reads the numbers into the production log, and the chatbot answers from the same database. The customer portal reads from the same data, so there is one source of truth. Errors are watched with Sentry.

```
React app ⟶ Node.js API ⟶ PostgreSQL ⟶ S3 photos ⟶ AI OCR ⟶ production log ⟶ chatbot and customer portal
```

결과 / RESULT

- Office team: 3 people to 1 manager
- 1+ hour of messenger replies saved daily, plus 1 hour of floor walking
- Cloud cost: -90% after moving from Lambda to EC2
- A second factory with 50 employees signed through my own outreach

트러블슈팅 / TROUBLESHOOTING

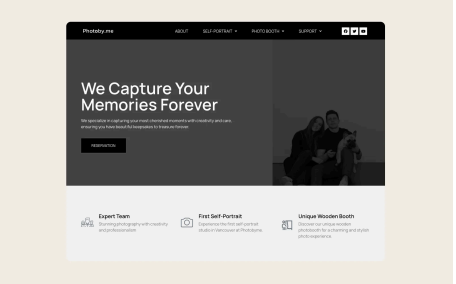

Problem: the first version ran on AWS Lambda, but an always-on ERP made the bill too high. Cause: Lambda pricing suits occasional bursts, not a system the whole factory uses all day. Fix: I moved the app to EC2 and S3, which cut infrastructure cost by 90%. A second problem was that workers kept writing on boards instead of typing. I let them keep the habit and had them photograph the boards, then read the photos with AI OCR. Result: 10 stations are covered and about 1 hour of floor walking is saved every day.

다음 / NEXT

Build a React Native app for the factory floor. A defect detection model is in progress and not shown here.

Photobyme: self-portrait studio

3,000+ sessions, **300+ events**, **$8-10K MRR**, sold

기간 / PERIOD
Apr 2022 – Jan 2026

소속 / ORG
Photobyme (my studio)

역할·인원 / ROLE & TEAM
Founder. Founder; 10 part-time staff

기여도 / CONTRIBUTION
100%

스택 / STACK
Web app, Payments, Hardware

Website: photobyme.ca

상태 / STATUS
Acquired

서부 캐나다 첫 셀프 포트레이트 스튜디오(2022)입니다. 사진가 없이 예약, 결제, 세션이 자동으로 돌아가는 웹을 혼자 만들었고, 직접 만든 포토부스로 행사 300회 이상을 진행했습니다. 3,000회 이상의 세션, 월 매출 $8-10K, 파트타임 10명 운영을 거쳐 사업을 매각했습니다.

문제 / PROBLEM

Professional photo shoots cost too much and book out for weeks, which is overkill for people who just want good portraits. Rental photo booths were mostly plastic, clashed with wood-accented Canadian venues, and still cost a premium.

구현 / WHAT I BUILT

I launched Western Canada's first self-portrait studio in **2022**: a walk-in studio with no photographer, with sessions starting at CA$75. I built the whole booking site alone on React and Square checkout, with online booking, payment, and automated session handling. For events I designed and built wooden photo booths myself, which let us price about **30-40%** below typical rentals. An AI support chatbot, built on LangChain and a local model with RAG, cut the time spent answering customers. A team of **10** part-time staff ran sessions and events.

구조 / ARCHITECTURE

One website handles booking, payment, and session setup, so a customer can walk in and shoot without help from staff. The booths are separate hardware that I built and set up on-site, with the same software running them.

```
React booking site ⟶ Square checkout ⟶ automated session flow ⟶ studio and wooden photo booths
```

결과 / RESULT

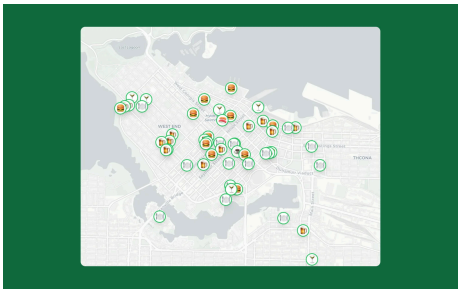

- **3,000+** self-portrait sessions
- **300+** photo booth events
- Monthly revenue of **$8-10K**, with **10** part-time staff and no full-time photographers
- Business sold to another operator

다음 / NEXT

The business now runs under its new owner. I would apply the same self-serve model to other service businesses.

HappyHour Map

Live web app; real-time filter by time, distance, cuisine, and deal

Live app: happyhourmap.app

상태 / STATUS
Live

밴쿠버 해피아워 할인을 찾는 개인 풀스택 웹앱입니다. 시간, 거리, 음식 종류, 할인 조건으로 실시간 필터링할 수 있고 현재 운영 중입니다. AI로 웹의 해피아워 정보를 모아 정리하는 수집 파이프라인으로 수작업 입력을 85% 이상 줄였습니다.

문제 / PROBLEM

Happy hour deals are popular but scattered across many restaurant sites and social accounts. Diners have to hunt for them, and small restaurants have few ways to promote the deals that fill their quiet hours.

구현 / WHAT I BUILT

I built HappyHour Map, a live web app that shows nearby deals and filters them in real time by time, distance, cuisine, and deal type. It is a responsive React and TypeScript front end with a Node.js backend, and it uses the Google Maps API for location. To fill it with data, I wrote a collection pipeline in Python that scrapes the web and uses a local AI model on LangChain to pull out the deal details and standardize them. This cut manual data entry by over **85%**.

구조 / ARCHITECTURE

Pages are rendered on the server for the first load, which helps search engines find them, then the browser takes over for filtering. The data pipeline runs separately and writes cleaned deals into the database that the app reads.

```
Python scraper ⟶ local LLM extraction ⟶ database ⟶ Node.js API ⟶ React app with Maps
```

결과 / RESULT

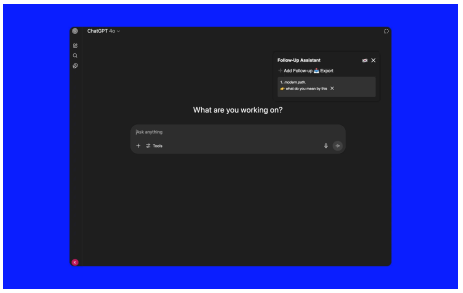

- **4** live filters: time, distance, cuisine, deal
- Manual data entry cut by over **85%**
- SEO metrics up **45%**, with load times under **2** seconds

다음 / NEXT

Add restaurant-submitted deals and alerts for saved neighborhoods.

ChatGPT Follow-up Assistant

Published on the Chrome Web Store

역할·인원 / ROLE & TEAM
Solo developer. Solo

기여도 / CONTRIBUTION
100%

스택 / STACK
Chrome extension, JavaScript, ChatGPT

링크 / LINKS
Chrome Web Store:
chromewebstore.google.com/detail/chatgpt-follow-up-assista/lkmfpkkbjnodlanaleadcolhjelejgam

상태 / STATUS
Published

ChatGPT 대화 중 떠오른 후속 질문을 놓치지 않게 모아 주는 크롬 확장 프로그램입니다. 답변에서 텍스트를 선택해 한 번에 질문으로 추가하고, 사이드 패널에서 정리한 뒤 한 번에 대화로 보낼 수 있습니다. 한국어와 영어 템플릿을 지원하고 모든 데이터는 브라우저 안에만 남습니다. 직접 쓰려고 만든 도구를 다듬어 Chrome Web Store에 게시했습니다.

문제 / PROBLEM

When I studied with ChatGPT, long answers raised questions that I forgot by the time I finished reading. Typing them later, without the original context, made the conversation scattered.

구현 / WHAT I BUILT

I built a Chrome extension that captures those questions as they come up. Select any text in an answer and add it as a follow-up with **1 click**. The questions collect in a side panel where you can review, edit, reorder, and delete them. When you are ready, one click sends the whole list back into the conversation. It has English and Korean templates, and everything stays in the browser with no outside server. I built it for myself, then polished and published it.

구조 / ARCHITECTURE

The extension is plain JavaScript, HTML, and CSS. It reads the ChatGPT page, watches for changes as answers stream in, and adds its own panel styled to match. Questions are saved with the Chrome storage feature, so nothing leaves the user's computer.

```
Chrome extension ⟶ page observer ⟶ side panel UI ⟶ Chrome storage ⟶ export back into the chat
```

결과 / RESULT

- Published on the Chrome Web Store
- **2** languages supported, English and Korean
- **0** external servers, all data stays in the browser

다음 / NEXT

Add shareable question lists and support for other AI chat sites.
